

Nodes are an essential part of the Kubernetes cluster. They are the machines where your cluster's container workloads are executed. In this lesson, we will discuss what nodes are in Kubernetes, and we will explore some ways in which you can find information about nodes in your cluster.

Here are the commands used in this lesson:

- Get a list of nodes:

```
kubectl get nodes
```

- Get more information about a specific node:

```
kubectl describe node $node_name
```
